Citation: Charles O. Todo, Harrietta I. Ojarikre, and, John N Igabari (2022) Optimal EDC bill-mix through parameters tuning in an optimization model, International Journal of Mathematics and Statistics Studies, Vol.10, No.1, pp.20-29

#### Abstract

There has been the problem of inappropriate billing of customers by Electricity Distribution Companies (EDCs) in Nigeria. We considered an explicit minimization constrained optimization model where the objective and constraint functions are all linear, for a scenario involving bills (EDCs) generate for their customers. Our model optimizes the bills for different household types. To get a bill-mix that is optimal in the view of customers, model parameters are tuned to fit in with field data collected by the companies. The model was implemented using the computer software, Solver, and the results are presented.

KEYWORDS: optimization, solver, parameter tuning, customers, bill, model, EDC

## INTRODUCTION

Viewing optimization as a collection of mathematical principles and methods used for solving quantitative problems that proffer solutions in diverse disciplines, including physics, biology, engineering, economics, and business as quantitative problems in these different disciplines have important mathematical elements in common and because of this commonality, many problems can be formulated and solved by using the unified set of ideas and methods that make up the field of optimization (Wright, 2021). The current trend in optimization is that any solution approach that seeks to maximize or minimize a given entity is an optimization process irrespective of the domain. For instance, Floudas et al. (2013) applied optimization to the problem of climate change; Gunantara (2018) applied multi-objective optimization (MOO) in the field of politics; Marchuk (1976) investigated the environment and problems of optimizing the distribution of industrial enterprises; Ojarikre (2018) compared block-structured linear programming (LP) models against other practical optimization methods for solving downstream refinery problems using a solution method different from the existing ones; Soroush et al. (2009) studied a static single machine scheduling problem in which processing times, due-dates, and penalties for not completing jobs on time are distinct arbitrary random variables and where the
objective was to identify an optimal sequence, which minimizes the expected weighted sum of a quadratic function of job lateness.

## The Problem

There has been the issue of inappropriate billings of EDCs customers in Nigeria by these companies. According to Emeka (2010), the current customer classification is too large for ease of understanding by officials of the EDCs. This statement by an official of Nigerian Electricity Regulatory Commission (NERC) shows that no scientific approach is being used by electricity providers and distributors in Nigeria with respect to billing. This necessitated the paper.

## The Solution

We developed a model that optimizes the bills for different household types. To achieve optimal bill-mix for different household types, appropriate parameters of the model are tuned. In our model, the parameters include bills generated by the EDCs for electricity consumption per month for each household type, and the quantity of electricity consumed by each electrical appliance.

## Model Formulation

Compactly and implicitly, we are looking at the model of the form:

## Minimizing $f_{o}(x)$

Subject to $f_{i}(x) \geq b_{i} ; i=1, \ldots, m$
where $f_{o}(x)$ is the objection function and the $f_{i}(x)$ are the constraints.
In the less compact form, we have:
Minimize $\quad c_{1} x_{1}+\ldots+c_{n} x_{n}$
Subject to $\quad a_{11} x_{1}+\ldots+a_{1 n} x_{n} \geq b_{1}$
$\mathrm{a}_{\mathrm{m} 1} \mathrm{X}_{1}+\ldots+\mathrm{a}_{\mathrm{mn}} \mathrm{X}_{\mathrm{n}} \geq \mathrm{b}_{\mathrm{m}}$
$\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{n}} \geq 0$
Where:
The $c_{j}$ 's are the bill generated by an EDC for each household type per month, $j=1, \ldots, 6$.
The $\mathrm{x}_{\mathrm{j}}$ 's are the number of each household type, $\mathrm{j}=1, \ldots, 6$.
The $\mathrm{a}_{\mathrm{ij}}$ 's are the kWh consumed by each electrical appliance for each household; type, $\mathrm{i}=1, \ldots$, $19, \mathrm{j}=1, \ldots, 6$.

## Model Decision Variables

We considered six household types as follows:
the number of one-room apartments $=x_{1}$
the number of bed-sitter apartments $=x_{2}$
the number of room-and-parlour apartment $=x_{3}$
the number of self-contained apartments $=x_{4}$
the number of two-bed-room apartments $=\mathrm{x}_{5}$
the number of three-bed-room apartments $=\mathrm{x}_{6}$

## Model Constraints

We considered nineteen household electrical appliances and the restrictions imposed on them are the constraints.

Table 1: The number of each appliance owned by one unit of each apartment type.

|  | 1-Room | Bed-Sitter |  <br> Parlour | Self-Contained | 2-Bed- <br> Room | 3-Bed- <br> Room |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Fan $\left(\mathrm{x}_{1}\right)$ | 1 | 1 | 2 | 3 | 4 | 5 |

| Desktop Computer $\left(\mathrm{x}_{14}\right)$ | 1 | 1 | 1 | 2 | 2 | 2 |
| Laptop Computer $\left(\mathrm{x}_{15}\right)$ | 1 | 1 | 1 | 1 | 1 | 1 |
| TV (x 16$)$ | 1 | 1 | 1 | 1 | 1 | 1 |
| Stereo Receiver $\left(\mathrm{x}_{17}\right)$ | 1 | 1 | 1 | 0 | 1 | 1 |
| Vacuum Cleaner $\left(\mathrm{x}_{18}\right)$ | 0 | 0 | 0 | 0 | 1 |  |
| Washing Machine $\left(\mathrm{x}_{19}\right)$ | 0 | 0 | 0 | 1 | 1 |  |

The monthly EDC bill (generated) for each household type in Nigeria is N700, N1,000; N1,500; $\mathrm{N} 2,000$, $\mathrm{N} 3,000$; and $\mathrm{N} 4,500$ for household type $1,2,3,4,5$, and 6 respectively. Given that household electricity consumption works out at between 8 and 10 hours per day (thus averaging 9 hours per day in Nigeria) and according Massiha (2002), to calculate the kWh for a specific appliance, multiply the power rating (watts) of the appliance by the amount of time (hrs) you use the appliance and divide by 1000; Table 2 presents the watts rate for each appliance, along with

Vol.10, No.1, pp.20-29, 2022

## The Proposed Model

Given the information contained in Table 1 and Table 2, implicit form of the model:
Minimize $\quad c_{1} x_{1}+\ldots+c_{n} x_{n}$

Subject to $\quad a_{11} x_{1}+\ldots+a_{1 n} x_{n} \geq b_{1}$

$$
a_{m 1} x_{1}+\ldots+a_{m n} x_{n} \geq b_{m}
$$

$\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{n}} \geq 0 ; \mathrm{n}=6, \mathrm{~m}=19$
becomes explicit as:

$$
\begin{aligned}
& \text { Optimize Cost }=700 \mathrm{x}_{1}+1000 \mathrm{x}_{2}+1500 \mathrm{x}_{3}+2000 \mathrm{x}_{4}+3000 \mathrm{x}_{5}+4500 \mathrm{x}_{6} \\
& \text { Subject to } \quad 0.080 x_{1}+0.080 x_{2}+0.160 x_{3}+0.240 x_{4}+0.320 x_{5}+0.400 x_{6} \geq 345 \\
& 0.075 x_{1} 0.100 x_{2}+0.250 x_{3}+0.240 x_{4}+0.350 x_{5}+0.425 x_{6} \geq 391 \\
& 0.900 \mathrm{x}_{4}+2.700 \mathrm{x}_{5}+3.600 \mathrm{x}_{6} \geq 1944 \\
& 0.250 \mathrm{x}_{1}+0.250 \mathrm{x}_{2}+0.250 \mathrm{x}_{3}+0.250 \mathrm{x}_{4}+0.500 \mathrm{x}_{5}+0.500 \mathrm{x}_{6} \geq 540 \\
& 2.000 x_{1}+2.000 x_{2}+2.000 x_{3}+2.000 x_{4}+2.000 x_{5}+2.000 x_{6} \geq 360 \\
& 4.000 \mathrm{x}_{4}+8.000 \mathrm{x}_{5}+12.00 \mathrm{x}_{6} \geq 3240 \\
& 1.500 \mathrm{x}_{4}+1.500 \mathrm{x}_{5}+1.500 \mathrm{x}_{6} \geq 1215 \\
& 3.000 x_{4}+3.000 x_{5}+3.000 x_{6} \geq 270 \\
& 1.400 \mathrm{x}_{1}+1.400 \mathrm{x}_{2}+1.400 \mathrm{x}_{3}+1.400 \mathrm{x}_{4}+1.400 \mathrm{x}_{5}+1.400 \mathrm{x}_{6} \geq 252 \\
& 1.300 \mathrm{x}_{5}+1.300 \mathrm{x}_{6} \geq 108 \\
& 1.700 x_{1}+1.700 x_{2}+1.700 x_{3}+1.700 x_{4}+1.700 x_{5}+1.700 x_{6} \geq 306 \\
& 1.100 \mathrm{x}_{4}+1.100 \mathrm{x}_{5}+1.100 \mathrm{x}_{6} \geq 99 \\
& 1.000 \mathrm{x}_{4}+1.000 \mathrm{x}_{5}+1.000 \mathrm{x}_{6} \geq 90 \\
& 0.150 \mathrm{x}_{1}+0.150 \mathrm{x}_{2}+0.150 \mathrm{x}_{3}+0.150 \mathrm{x}_{4}+0.150 \mathrm{x}_{5}+0.150 \mathrm{x}_{6} \geq 121 \\
& 0.100 \mathrm{x}_{1}+0.100 \mathrm{x}_{2}+0.100 \mathrm{x}_{3}+0.200 \mathrm{x}_{4}+0.200 \mathrm{x}_{5}+0.200 \mathrm{x}_{6} \geq 121 \\
& 0.120 \mathrm{x}_{1}+0.120 \mathrm{x}_{2}+0.120 \mathrm{x}_{3}+0.120 \mathrm{x}_{4}+0.240 \mathrm{x}_{5}+0.240 \mathrm{x}_{6} \geq 259 \\
& 0.300 x_{1}+0.300 x_{2}+0.300 x_{3}+0.300 x_{4}+0.300 x_{5}+0.300 x_{6} \geq 486 \\
& 0.120 \mathrm{x}_{5}+0.120 \mathrm{x}_{6} \geq 72 \\
& 0.150 \mathrm{x}_{5}+0 \mathrm{~b} .150 \mathrm{x}_{6} \geq 90
\end{aligned}
$$

$\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}, \mathrm{x}_{4}, \mathrm{x}_{5}, \mathrm{x}_{6} \geq 0$

## Implementation of Model

The above model was implemented using the computer software (Microsoft Excel LPP Solver).

## RESULTS

The extracted results are presented below:

## Interpretation of Results and Discussion

Extracting the results show that given the bills generated for the different household types, there should be in the locality:

438 One-Room apartments
319 Room \& Parlour apartments
213 Self-Contained apartments
648 Two-Bed Room apartments
2 Three-Bed Room apartments and
no Bed-Sitter apartments.

## Parameters Tuning

If the above distribution aligns with field data collected by an EDC, there would be no complaints by the customers, but if not, the cj's are tuned until the result got from the model converges to field data (which are the actual numbers of these household types in the locality) and the $\mathrm{c}_{\mathrm{j}}$ 's got from that tuning is the optimal bill-mix.

The constraints for fans, LED light bulbs, AC air conditioners, and stereo receivers are binding, while those for all other appliances are not binding. For this results, the total cost is N3,159,114.754 for the locality.

## CONCLUSION

This work, if implemented will be able to solve the age-long problem of inappropriate billing of customers by Electricity Distribution Companies (EDCs) in Nigeria through parameters tuning of the model parameters such that results got from the model converge to field data. The EDCs would need to demarcate all the areas they serve into defined units of clusters of appropriate distributions of the different house-hold types.
